

The matrix (7-2) is called the **companion matrix** of the monic polynomial  $p_\alpha$ .

**Theorem 2.** *If  $U$  is a linear operator on the finite-dimensional space  $W$ , then  $U$  has a cyclic vector if and only if there is some ordered basis for  $W$  in which  $U$  is represented by the companion matrix of the minimal polynomial for  $U$ .*

*Proof.* We have just observed that if  $U$  has a cyclic vector, then there is such an ordered basis for  $W$ . Conversely, if we have some ordered basis  $\{\alpha_1, \dots, \alpha_k\}$  for  $W$  in which  $U$  is represented by the companion matrix of its minimal polynomial, it is obvious that  $\alpha_1$  is a cyclic vector for  $U$ . ■

**Corollary.** *If  $A$  is the companion matrix of a monic polynomial  $p$ , then  $p$  is both the minimal and the characteristic polynomial of  $A$ .*

*Proof.* One way to see this is to let  $U$  be the linear operator on  $F^k$  which is represented by  $A$  in the standard ordered basis, and to apply Theorem 1 together with the Cayley-Hamilton theorem. Another method is to use Theorem 1 to see that  $p$  is the minimal polynomial for  $A$  and to verify by a direct calculation that  $p$  is the characteristic polynomial for  $A$ . ■

One last comment—if  $T$  is any linear operator on the space  $V$  and  $\alpha$  is any vector in  $V$ , then the operator  $U$  which  $T$  induces on the cyclic subspace  $Z(\alpha; T)$  has a cyclic vector, namely,  $\alpha$ . Thus  $Z(\alpha; T)$  has an ordered basis in which  $U$  is represented by the companion matrix of  $p_\alpha$ , the  $T$ -annihilator of  $\alpha$ .

## Exercises

- 1. Let  $T$  be a linear operator on  $F^2$ . Prove that any non-zero vector which is not a characteristic vector for  $T$  is a cyclic vector for  $T$ . Hence, prove that either  $T$  has a cyclic vector or  $T$  is a scalar multiple of the identity operator.
- 2. Let  $T$  be the linear operator on  $F^3$  which is represented in the standard ordered basis by the matrix

$$\begin{bmatrix} 2 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & -1 \end{bmatrix}.$$

Prove that  $T$  has no cyclic vector. What is the  $T$ -cyclic subspace generated by the vector  $(1, -1, 3)$ ?

- 3. Let  $T$  be the linear operator on  $C^3$  which is represented in the standard ordered basis by the matrix

$$\begin{bmatrix} 1 & i & 0 \\ -1 & 2 & -i \\ 0 & 1 & 1 \end{bmatrix}.$$
